

Acodesin, Frances Ann C.

BSIT - 3D

Step-by-step commands I use on how to upload my files using git bash.

Step1: **git init** - I used this command to start a new Git repository inside my lab folder. It prepares the folder so git can track changes.

Step2: **git add .** - This adds all files in the folder to Git's staging area, meaning they're ready to be committed.

Step3: **git commit -m "message"** - This creates a snapshot of the files with a message explaining what I did.

Step4: **git branch -M main** - I renamed my default branch to main because GitHub uses main as the primary branch.

Step5: **git remote add origin <URL>** - I connected my local repository to the remote repository I made on GitHub.

Step6: **git push -u origin main** - I pushed (uploaded) my files from my computer to GitHub so they're available online.
